

2023 STANDING ACREAGE - FINAL ESTIMATE

In cooperation with the Almond Board of California

Released: November 21, 2023

RESULTS

Each year Land IQ produces an in-year, statewide almond acreage estimate. This estimate is the result of extensive ground truthing and advanced remote sensing analytics, allowing Land IQ to differentiate almond orchards from other tree and annual crops.

The result is a highly accurate mapping of almonds that are a minimum of three years old. Almond orchards that are less than 3 years old cannot be consistently differentiated from other similarly aged tree crops using remotely sensed methods. The ground truthing data, proportionality of almonds to other tree crops, and other lines of evidence are used to numerically estimate acreage for orchards that are one and two years old. Both the remotely sensed and numerical estimates are combined for a total statewide acreage estimate. The 2023 estimate is 98.8% accurate.

As a result, the 2023 acreage estimate is:

- **189,005 non-bearing acres**
(defined as those orchards planted in 2021, 2022, and 2023)
- **1,374,331 bearing acres**
(defined as those orchards planted in 2020 and earlier)
- **1,563,336 total acres**
(defined as total standing acres during the growing season of 2023)

Each mapping year, Land IQ not only maps all almond orchards within the state, but also applies a separate algorithm to quantify the age of each individual orchard. The accuracy of this estimate is greater than 95% at +/- 1 year. Based on that analysis, Land IQ determined that :

- 12 percent of California's almond orchards were 1-3 years old,
- 47 percent were between 4 and 10 years old,
- 30 percent were between 11 and 20 years old,
- 5 percent were between 21 and 25 years old, and
- 5 percent were over 25 years old.

INTRODUCTION

Beginning in 2019, the Almond Board of California (ABC) began an annual mapping process with two acreage summaries, one delivered in April and one delivered in November, of the same production year. Land IQ's April delivery aligns with the United States Department of Agriculture (USDA) – National Agricultural Statistics Service (NASS) California Almond Forecast, which is an initial subjective forecast for acreage and production.

APPROACH

Land IQ draws upon multiple lines of evidence including agronomic and remote sensing knowledge, unique field boundaries, robust on-the-ground verification, customized image analysis, artificial intelligence and machine learning algorithms to classify almond orchards.

For each mapped year, the following steps are taken as the basis for determination of bearing acreage and the numerical estimate of non-bearing acreage.

Imagery Acquisition

Evaluate and acquire imagery from various sources based upon cost and spectral, spatial and temporal resolution suitability. New imagery sources allow for annual mapping of almonds.

Field Boundary Delineation

Utilize imagery and other resources to delineate individual fields defined as a homogenous crop. These boundaries are not legal boundaries of the property and do not include roads, homes or farmsteads. Irrigated field boundary positional accuracies are +/- 6 feet at a 95% confidence interval.

Ground Truthing

Identify and geo-reference crops through thousands of miles of actual verified orchards from Tehama to Kern County. These data provide necessary training data for algorithms as well as validation data for the classification.

Remote Sensing Analysis

Utilize custom image analysis, artificial intelligence, and machine learning algorithms to determine crop type. This allows for the differentiation of almond orchards from other tree and annual crops. Accuracy assessments are performed using statistical probability and validated against ground truth information.

Change Analysis and Update

Determine which orchards have been removed or added using a change analysis as part of the overall remote sensing efforts.

Non-Bearing Estimate

During the second mapping event, an estimate of non-bearing acreage is conducted, taking into account the data collected with ground truthing in the summer months.

*The county level, non-bearing acreages for 2021 are approximately 75% spatially mapped and age-verified orchards. The remaining 2021 acreages are numerically estimated according to the spatially mapped acreage and ground truthing during 2023. While bearing acreage mapping has been validated with an accuracy of 98.8%, non-bearing numerical acreage estimates should be understood to have an estimated +/-10% potential variability.

**The estimated non-bearing acreages for 2022 and 2023 are numeric estimates only and are based on extensive ground truthing, image analysis, and other lines of evidence. While bearing acreage mapping has been validated with an accuracy of 98.8%, non-bearing numerical acreage estimates should be understood to have an estimated +/-10% potential variability.

*** The Bearing Grand Total and Grand Total include standing acreage that is considered stressed or abandoned and may not be in full production. Please refer to the Removals Report for more information.

2023 REMOVALS UPDATE

In cooperation with the Almond Board of California

Released: November 21, 2023

RESULTS

Each year Land IQ produces an initial bearing acreage estimate in April, which includes a removals analysis as of March 31, 2023. In addition to the spatial analysis, a numerical estimate of orchards to be removed between April 1, 2023 and August 31, 2023 was provided based on actual ground truthing, historical analyses, and current conditions.

Beginning in 2021, due to extreme drought and significant water supply issues, Land IQ began performing an additional analysis to determine how many acres were removed during the crop year or in various degrees of abandonment.

As a result, the 2023 removals estimate was updated:

- 58,314 - Acres removed: September 1, 2022 - March 31, 2023
- 24,644 - Acres removed: April 1, 2023 - August 31, 2023
- 82,958 - Total acres removed in 2023 crop year

The average age of removed orchards in the 2023 crop year was 21.8 years old.

Considering abandoned orchards may have the ability to recover dependent on conditions, the number of acres in various degrees of abandonment was also analyzed. These orchards are included in the standing acreage numbers provided, as they have not been removed.

- 21,411 acres - Stressed in Crop Year (CY) 2023 or 2022
- 11,523 acres - Potentially Abandoned in CY 2023 or 2022
- 7,986 acres - Long Term Abandoned

Table 1. Removed and Potentially Abandoned Acreage by County

Placer	0	0			

DEFINITIONS

The spatial analyses of removed and abandoned orchards resulted in varied conditions among orchards. As a result, Land IQ has defined the following conditions:

Removed Orchards

Orchards that were removed between September 1, 2022 and August 31, 2023.

Potentially Abandoned Orchards

Orchards that were in various levels of abandonment:

- **Stressed - CY 2023 or 2022** - These orchards show visual stress, but do not appear fully abandoned. Many orchards have shown a drop in Normalized Difference Vegetative Index (NDVI) in the late summer or early fall, but have likely been irrigated for some of the year. This also includes relatively young orchards that have shown a drop in vigor, but do not have high enough canopy coverage to clearly identify abandonment. Although not always true, it is assumed that most of these orchards will produce in future years. Condition of these orchards will continue to be monitored.
- **Potentially Abandoned - CY 2023** - These orchards were potentially abandoned within the 2022 or 2023 crop year and appear not to have been irrigated for most or all of the year.
- **Long Term Abandoned** - These orchards have been abandoned prior to the 2022 or 2023 crop year, but have not yet been removed.

Source: Land IQ, California Statewide Almond Mapping - 2023. Based on data from USDA National Agricultural Imaging Program (NAIP), USGS Landsat, and other private imagery resources.

Stressed Crop Year (CY) 2023 or 2022: These orchards show visual stress, but do not appear fully abandoned. Many orchards have shown a drop in NDVI in the late summer or early fall, but have been watered for most of the year. This also includes relatively young orchards that have shown a drop in vigor, but do not have high enough canopy coverage to clearly identify abandonment.

Potentially Abandoned Crop Year (CY) 2023 or 2022: These orchards were potentially abandoned and not appear to have been watered for most of the 2023 and 2022 crop year.

Abandoned Long Term: These orchards look to have been abandoned prior to the 2022 and 2023 crop years but have not yet been removed.

Source: Land IQ, California Statewide Almond Mapping - 2023. Based on data from USDA National Agricultural Imaging Program (NAIP), USGS Landsat, and other private imagery resources.

Stressed Crop Year (CY) 2023 or 2022: These orchards show visual stress, but do not appear fully abandoned. Many orchards have shown a drop in NDVI in the late summer or early fall, but have been watered for most of the year. This also includes relatively young orchards that have shown a drop in vigor, but do not have high enough canopy coverage to clearly identify abandonment.

Potentially Abandoned Crop Year (CY) 2023 or 2022: These orchards were potentially abandoned and not appear to have been watered for most of the 2023 and 2022 crop year.

Abandoned Long Term: These orchards look to have been abandoned prior to the 2022 and 2023 crop years but have not yet been removed.
